CONNECTING SOFTWARE
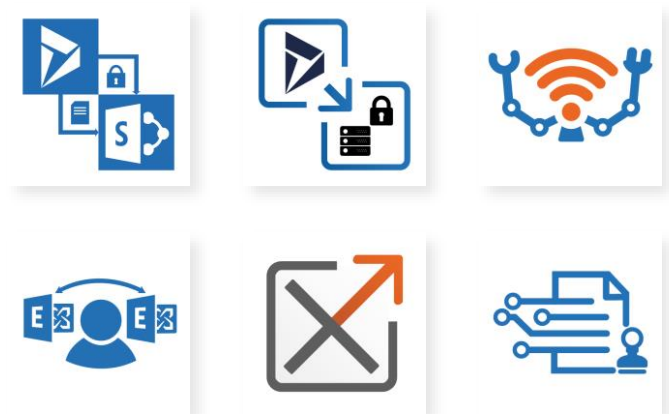

SOFTWARE INNOVATION
for more productive business processes

H How to simplify even the most complex software integration? With a platform that allows every developer to design their own integration solutions without extensive effort and lengthy training. It was an unprecedentedly bold idea, considering the jungle of industry standards surrounding it. Even coming from a small European country wouldn't stop Thomas Berndorfer from transforming it into an ambitious IT project.

In 2007, Thomas established Connecting Software in Vienna, Austria. Thanks to previous entrepreneurial success with his CNS Group, an IT company, he was able to self-finance and build Connecting Software from the ground up. As an accomplished entrepreneur, Thomas was all too familiar with the difficulties that businesses encounter whilst using various applications that are incompatible. To eliminate these obstacles, he decided to turn his dream of easy software integration into reality.

"The goal was to discover the key that would unlock the door to the world of easy, fast and cost-effective integration solutions."

Thomas didn't want to compromise his vision by bringing in banks or venture capitalists. Instead, he chose to invest his income generated by the CNS Group to fund the project. Assembling a talented international team, the development of a one-of-a-kind integration platform began in 2008.

The goal was to discover the key that would unlock the door to the world of easy, fast, and cost-effective integration solutions. After comprehensive research, Thomas and the team decided to let developers stay in their best-known programming language and use only standard procedures.

Two years of development and thorough testing came to fruition in a market-ready solution that masters the chaos of software industry and standards. Making software integration easy, fast and painless for any developer. Connect Bridge, a unique software integration platform, was first offered to partners and customers in 2012. Now, any developer from any technology can learn to work with Connect Bridge within 2 hours.

Since the introduction of Connect Bridge, the company has launched more than 30 products which currently solve software integration challenges for clients all over the world. Finally, to meet the increasing demand for the services, in addition to the headquarters in Austria and its first development hub in Slovakia, the company has opened offices in the US and Portugal.

CONNECT BRIDGE
Integration platform to connect from nearly any software to hundreds of business applications, and now, the Industrial Internet of Things (IoT).

Compared to custom development and integration suites Connect Bridge offers:
LOW Cost
HIGH Flexibility
FAST Time to Market
LOW Risk
HIGH Compatibility
UNIQUE SOLUTIONS

CONNECTORS:
- Dynamics 365 CE / FO / BC
- SharePoint
- Exchange
- Salesforce
- Oracle
- SAP
- OPC UA
- And many more

**Featured Products – Built on Connect Bridge:**
- CB Dynamics 365 to SharePoint Permissions Replicator
- CB Exchange Server Sync
- Document Extractor

"Salesforce storage is incredibly expensive. Having Document Extractor as an alternative to what those fees might be... You can't really put a price tag on that!"

Andrew DeGarmo
Director of CRM at MSU

"Integrating Truth Enforcer was quick. In the end, we got a straightforward solution for a complex problem."

João Marçal
Digital Products Development Manager

SO WHAT EXACTLY IS THE CONNECT BRIDGE PLATFORM?

When two people speak different languages and don't understand each other, they use a translator service. But who is going to help two software applications if they "speak" different programming languages? This is where the Connect Bridge Platform comes into play. It functions as a translator and enables different technologies to communicate with each other facilitating business processes in companies and making them more productive and cost-effective.

One of the greatest features of the Connect Bridge Platform is that it is easy to use and customise. Even with basic programming knowledge, any developer can securely connect to a wide range of business software without the need to learn their documentation.

Another outstanding feature of the Platform is its flexibility. It supports most modern software and software going back 30 years. Moreover, it can connect popular, widely used commercial applications with a company's unique, customized solutions. Organizations can run it on-premises, in the cloud, hybrid, and even mobile. The Platform simplifies the work of end users, and therefore partners worldwide choose Connect Bridge.

- Unique software integration platform by Connecting Software
- Enabled from any programming language via self-developed drivers
- No need to learn the code of connected systems. Use only abstracted SQL syntax as command language, which is parsed to target systems via API of producers. Therefore, there is no training needed
- 400+ pre-built connectors
- Saves time and money – reduces integration effort by at least 50% and saves up to 90% of time
- ROI within the first project
- No entry barriers – start integrating within the first 2 hours
- Connect from the cloud, on-premises, hybrid and mobile technologies of the last 30 years fast, easy, live and bidirectionally via ODBC, JDBC or Web Services drivers

Is there any connector ready to use?

Yes, absolutely. Using Connect Bridge as the core, we have developed our own solutions which take the burden off end users. These products demonstrate how easy, fast and efficient Connect Bridge is for solving complex, time-consuming and costly projects that might not be feasible otherwise.

Our in-house designed connectors cover more than 30 target systems.

OUR FLAGSHIP SOLUTIONS BUILT ON CONNECT BRIDGE PLATFORM

CB Dynamics 365 to SharePoint Permissions Replicator

Many companies use Dynamics 365 (CRM) together with SharePoint and exchange documents and accounts between them. It is a cost-effective pair that facilitates team collaboration – with one tremendous downside: privileges and permissions are not synchronised.

Meaning that any sensitive data stored in Dynamics like salaries, contract values, signatures and stamps are available to SharePoint users even if it is restricted in Dynamics 365. The only solution used to be to set up permissions manually for each SharePoint document related to records in CRM which would obviously take much time from managers and create the risk of mistakes due to the human factor.

Now you can do it automatically with CB D365 to SP Permissions Replicator. It is the only out-of-the-box solution in the world that remedies this issue by automatically synchronizing Dynamics 365 (CRM) privileges with SharePoint permissions. Maintain the same level of document confidentiality in both systems – automatically, without any extra access rights management required.

- A solution built on the Connect Bridge Platform
- Automatically replicates the entire Dynamics CRM security model to SharePoint
- Solves the security gap issue in the out-of-the-box Microsoft Dynamics CRM & SharePoint document integration
- Maintains document confidentiality in both systems without requiring extra access rights management
- Learn more about CB Permissions Replicator here

Scan the QR Code or click on to play the video

SharePoint Structure Creator

It automatically creates or selects document libraries in SharePoint based on defined rules to avoid reaching the unique permission scope threshold (5k unique permissions per SharePoint Online and 50k for SharePoint 2013, 2016, and 2019, usually achieved within 1-2 years for large organizations).

And it is smart. SharePoint Structure Creator will put documents into distributed document libraries which are created according to the rules you define:

- Based on a date (Yearly, Quarterly, Monthly, Weekly, Daily, or custom rule)
- Based on starting character(s) of record name
- Based on starting character(s) of record ID
- Document library per record

Scan the QR Code or click on to play the video

Drag & Drop and Metadata for Dynamics 365 CE

Drag & Drop and Metadata for Dynamics 365 CE transforms the document management experience with a custom grid that enables new functionality and enhances existing one. Here's what you can expect: Metadata for Enhanced Organization:

Scan the QR Code or click on to play the video

Users can edit each document's managed metadata directly within Dynamics 365 instead of having to go to SharePoint and enter the metadata there. Managed metadata can include tags, categories, or any other information your organization feels will help categorize documents. Drag & Drop for Effortless Uploads: You can drag and drop documents directly from your folders into the intuitive grid, making it straightforward to upload large amounts of documents. You can upload any number of files and any type of file as long as each file is under 50MB.

CB Dynamics 365 Seamless Attachment Extractor

All organizations reach the free storage limit in Dynamics 365 sooner or later. 70% of the database are usually documents and attachments, which one can't get rid of - but they harm the CRM performance capacity and undermine its functionality. Many organizations look for a solution to move attachments to a document management/storage system and not store them in the CRM, which is not designed for that.

How it works

Service ensures live transfer of all attachments uploaded to Dynamics 365 to a document management system of your choice. User experience is unaffected. The service actions are transparent. And the files are not leaving your systems – no data breach.

Scan the QR Code or click on to play the video

Documents remain accessible to users who have access to the respective record in Dynamics 365 without any modification of their workflows. Any changes to the Dynamics 365 attachments are projected to the configured external file storage on-the-fly.

▪ **Fully transparent & automated**

The service operates with complete transparency, logging all actions without disrupting users or workflows. Once set up, it runs automatically, allowing users to focus on their tasks.

▪ **Event-based**

It monitors attachment and document activities in Dynamics 365, updating changes to files in designated external storage when they occur.

▪ **Covers all operations**

The service supports standard activity entities like Email and Task, as well as Notes, and can be customized to work with any entity that supports annotations or attachments.

▪ **No middle service**

Files are transferred directly between Dynamics 365 and external storage, eliminating the need for intermediary services.
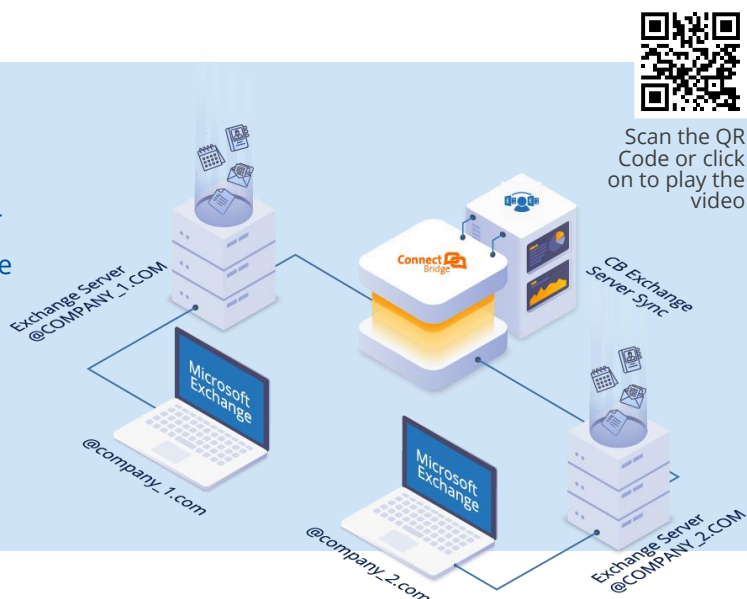

CB Exchange Server Sync

Do you work for two companies and use two different Outlook email accounts? If yes, you might know the pain of overlapping calendar appointments. Someone sends you an invite in one calendar thinking at that particular hour you are free, but in fact, you have another appointment – in another calendar of another Outlook mailbox.

This usually leads to confusion, missed meetings, apologies and frustration. Our CB Exchange Server Sync solves this problem by synchronizing your Outlook accounts. You see all calendar appointments, contacts, emails, tasks and public folders in one place.

Besides, CB Exchange Server Sync solves a lot of headaches for companies during major changes such as mergers, acquisitions and splits. It synchronises all exchange servers and improves the workflow. Fully customizable to specific business needs, this solution supports seamless migration of the entire Exchange / Outlook model to Office 365 or other Exchange versions.

- A solution built on the Connect Bridge Platform
- Secure synchronization and migration of data between Exchange Servers starting from version 2010 and newer
- Has features for secure access to calendars from outside the local network
- Can restrict confidential information from leaving the secure internal network
- Learn more about CB Exchange Server Sync here

Scan the QR Code or click on to play the video

CB Super Secure Exchange Server – [ADDON]

CB Super Secure Exchange Server is the solution that allows people to access their Exchange/ Outlook mailbox items outside the local network, for example, from their mobile devices, without any problem of getting hacked. This solution is vital for high-security enterprises – financial or legal establishments and the public sector. Thanks to the isolation of environments, you are not exposing your corporate Exchange server to the outside world and guaranteeing its security.

Exchange/Outlook Data Filter – [ADDON]

Exchange/Outloook Data Filter is a solution that allows to access your Exchange account outside the company, for example, on mobile devices, without exposing sensitive information. You can control what to restrict such as: attachments, address, signatures, names, documents and more. Fully customizable to your business needs and only for self-hosted deployment. The solution is built on the concept of the CB Exchange Server Sync which is used in large corporations around the world.

CB Exchange Server Sync for GCC High – [ADDON]

CB Exchange Server Sync for GCC-High is a self-hosted solution that offers secure bidirectional sync of Exchange items, namely calendars and tasks, between the GCC-High and external environments. You have the original item in one environment and the replica in another. As described below, you can choose to block certain items or parts of items on the replica.

CB Global Address List Sync – [ADDON]

The Global Address List (GAL) in a Microsoft Exchange server is a list of all end users - their email addresses and other mailbox information. You can think of it as a master list of all recipients but one that also includes all resources. A meeting room, for example, can be in a Global Address List. The Exchange admin can create additional GALs to separate users by location or department, but each user can only see and use one GAL. In Microsoft Outlook, when a specific user starts to compose a new message and selects the To, Cc, or Bcc buttons, Outlook displays their default address book. If they use an Exchange or Microsoft 365 account, that's the organization's Global Address List (GAL).

CB Exchange Server Sync for Gmail and Google Workspace

Synchronize and migrate data between Exchange, Office 365, Outlook, Hotmail, Gmail and G-Suite Calendars. The perfect solution for staying on schedule even with multiple calendars. You can start synchronizing all your personal and professional calendars and stop wasting your own time right now.

- ▪ The service runs in the background and is fully automated
- ▪ All calendars function as one, preventing double booking
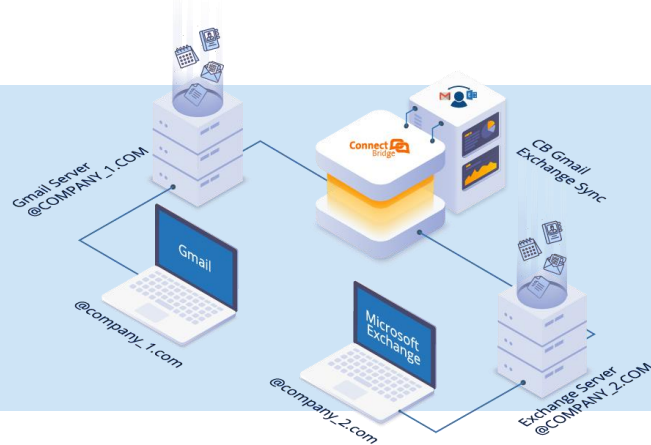

Scan the QR Code or click on to play the video

CB SharePoint Exchange Sync

SharePoint is a great platform for collaboration, and many businesses choose it as one place for document management, employee collaboration, process automation and other processes. At the same time, employees often gravitate towards using Exchange for the same purposes. Not because of its functionality but because of habit: everyone is used to solving work and personal tasks via Outlook even if it is not most productive from the workflow perspective. How to combine the need of business for structure, effectiveness and security with employees' preference for Exchange? CB SharePoint Exchange Sync based on the Connect Bridge platform provides this solution. It easily synchronises business entities between SharePoint and Exchange and automatically matches tasks, calendars, contacts and allows email and document backup. The synchronisation is automatic yet customisable and ensures high level of security and data integrity.

Document Extractor - Built for Salesforce platform™

Many companies using Salesforce platform™ look for cheaper data storage solutions. This can be done in SharePoint: with significant cost-cutting and excellent document management features. But how do we transfer these data without disrupting business processes?

Document Extractor by Connecting Software helps connect the two so that you continue working in Salesforce platform™ and store your data in SharePoint. More importantly, this solution allows companies to fully control documents and comply with the most rigorous regulation on data protection. How does it work?

Every time you upload a file to Salesforce, Document Extractor makes a copy of it in SharePoint. Then it creates a link from Salesforce to the file in SharePoint and finally deletes the file in Salesforce. As a user, you don't see any difference, but the files don't actually exist in Salesforce and thus don't occupy any space.

- A solution built on the Connect Bridge Platform
- Allows custom file stubbing
- Supports Community Users
- Non-salesforce users can also access files
- Compliant with security regulations
- Allows cost-effective file storage
- Learn more about Document Extractor here

Scan the QR Code or click on to play the video

CB Document Metadata Reporting for Salesforce®

Creating reports of your files in Salesforce can provide great insights, but there are some annoying limitations. CB Document Metadata Reporting is the add-on to make those limitations go away and take your reports to the next level.

With it, you can create custom reports for all your Salesforce files, including all metadata and custom fields you want. With CB Document Metadata Reporting, the user can create reports on all files in the organization. In fact, even if you need the user to create reports on files he is not allowed to see, Salesforce can be configured so that it is possible to include for reporting only.

Truth Enforcer
## Works for Salesforce, SharePoint, Power Automate and more

Enterprises need to respond to the demand for security controls within regulatory compliance. This solution creates an environment with data integrity and immutable proof of application. The auditability strength is enabled in a fast and more cost-efficient manner.

Across industry and region there will be multiple regulations for data privacy (eg.: GDPR), in the financial sector (eg.: SOX), information systems (eg.: ISO 27001), and others. Truth Enforcer is an up-to-date solution with a mindful approach to technology and regulation that empowers enterprises to guarantee integrity, protect credibility, and secure trust.

- Blockchain is a trusted technology for data protection and verification: decentralized, distributed, encrypted, and tamper resistant. Recommended for security-critical environments and industries with strict regulations

- Our solution seamlessly integrates with familiar environments like Salesforce or SharePoint, facilitating auditability of these or other customer/document management systems with just one click

- Original data (file's content) is never stored in the blockchain, only its hash. This makes the solution faster, affordable, and compliant with GDPR, CCPA/CPRA, DORA, HIPAA, and other regulations
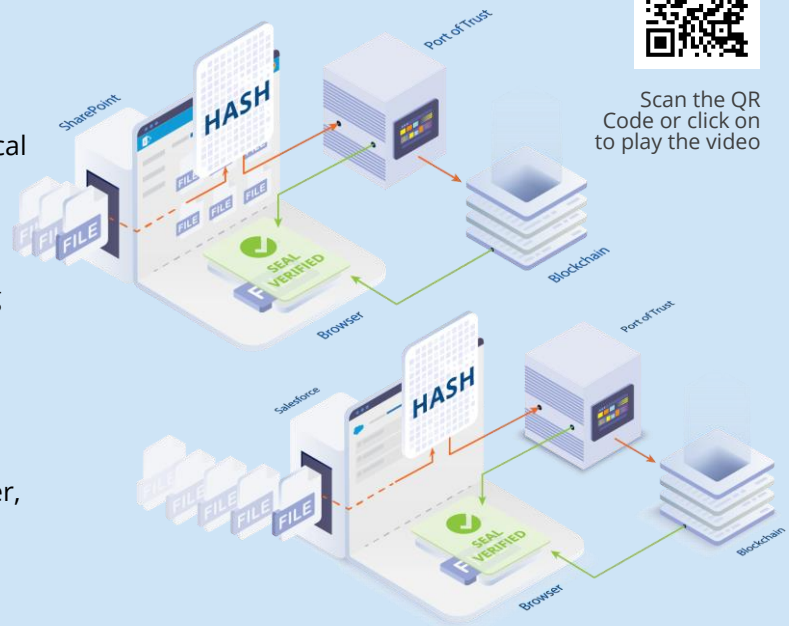

Scan the QR Code or click on to play the video

Port of Trust

Port of Trust acts as a digital notary, and it uses digital seals and the power of the blockchain to ensure the data integrity of your documents and files. **Port of Trust** is a service from Connecting Software to provide **proof** that your files and documents are authentic. For maximum **availability** and **security**, it is a service deployed in Microsoft Azure (no installation required!). It can also be recreated as an individual self-hosted installation if your specific needs so require.

Truth Verifier

Truth Verifier is an online solution for verifying files' authenticity. It is part of the CB Digital Port of Trust. **Anyone** can verify a file **anywhere** - Truth Verifier is available online. This means all stakeholders can trust their files - they can check if they have an untampered file at any moment in time.

If you have several sealed versions of the same file, you can use Truth Verifier to get a history of what happened to the file and find the most recent version. Truth Verifier builds a timeline for those files, so you get the big picture.

Truth Enforcer Power Automate Connector

Connect Truth Enforcer to your Power Automate workflows to secure any type of digital files and provide the ultimate level of trust. Using Truth Enforcer through Power Automate can help your organization meet regulatory standards and governance needs by making file authenticity and integrity easy to establish.

CB Digital Factory

Every machine in a factory produces a lot of data, and this connector integrates it with back-office business systems on a manager's desktop for easy visualisation, interpretation and more effective business flow. As is part of what is called Industry 4.0 or the Industrial Internet of Things (IIoT), and the CB Digital Factory built on the Connect Bridge platform allows smooth communication between machines and standard business application even though they "speak" different languages. This product is designed for OPC UA machine to machine communication protocol which is one of the most widespread protocols in industrial automation. Integrating machine data into business systems provides many benefits such as real-time decision-making in areas where any lag can lead to disastrous consequences; saving operating costs of machine park by timely maintenance; saving employees' time by removing administrative manual tasks; custom reporting, task automation, resource planning and much more. CB Digital Factory allows customised integration based on company needs. Most importantly, it is suitable even for small and medium-size enterprises with limited financing due to its unbeatable pricing.

Scan the QR Code or click on to play the video

- A solution built on the Connect Bridge Platform
- Suitable even for small, medium-sized manufacturers requiring a flexible, reliable solution with attractive, unbeatable pricing
- Independent of location, size, device – requiring less human interaction
- A junior developer can perform integration within hours
- Connect data sources exactly as you need to improve plant efficiency, free your valuable resources to focus on added-value tasks
